### Introduction

Pittsburgh residents rate high the livability of their neighborhoods and are more optimistic about them than they were five years ago. The positive attitudes, revealed in a recent city-wide survey, show that the city's neighborhoods are healthy and are becoming stronger.

These are the major conclusions of a research project directed by Dr. Roger S. Ahlbrandt, Jr., Associate Professor in the School of Social Work, University of Pittsburgh. The two-year project, jointly sponsored by the School of Social Work and the University Center for Social and Urban Research, surveyed 5,896 households throughout every neighborhood in the City of Pittsburgh. The survey asked questions pertaining to sense of community, local facility use, neighborhood conditions, neighboring patterns, participation in voluntary organizations, housing, public services, work, health, and social support systems.

This report describes the results of the survey, conducted by telephone in early 1980. The discussion focuses upon the attitudes of residents toward their neighborhoods and the uses residents make of those neighborhoods. The results are presented here as city-wide figures. Data for individual neighborhoods will be found in the appendix. Where appropriate, comparisons are made to the results of a 1975 survey contained in the Pittsburgh Neighborhood Atlas.

The research described in this report was supported by a grant from the Center for Studies of Metropolitan Problems, National Institute of Mental Health (#5-R01-MH33002-02). The authors wish to thank the Center for its support and, in addition, wish to thank staff members of the University Center for Social and Urban Research for their assistance throughout the data-gathering and data analysis phases of the project.

#### General Attitudes

Seventy-two (72) percent of all households interviewed rated their neighborhood a good or excellent place to live; and 29 percent said that conditions in the neighborhood had improved during the past two years compared to 16 percent who thought conditions had deteriorated, while the balance felt the neighborhood had remained the same.

Responses to these questions indicate significant improvement in the overall attitudes of Pittsburgh city residents toward their neighborhoods over the past five years. In 1975 almost an equal number of residents were satisfied (42%) as were dissatisfied (37%) with conditions in their neighborhoods; and at that time, only 13 percent of those interviewed thought their neighborhood was improving compared to 49 percent who believed it to be declining.

Satisfaction levels varied as a result of the characteristics of the respondents. Older respondents were more satisfied with the neighborhood than younger respondents; higher income households were more satisfied than lower income households; white respondents were more satisfied than black respondents; and homeowners were more satisfied than renters. Given these differences, the socioeconomic and demographic characteristics of individual neighborhoods must be taken into account in order to begin to understand why differences in satisfaction levels exist.

#### Neighborhood Identification

Neighborhood identification in Pittsburgh is strong. Ninety-three (93) percent of those interviewed know the name of their neighborhood, and 68 percent said their neighborhood had distinct boundaries.

#### Attachment to the Neighborhood

The majority (63%) of Pittsburgh's residents report that they are strongly attached to their neighborhood compared to only seven percent who report no attachment.

The strong attachment is reflected in the fact that once settled, Pittsburgh city residents don't like to move. The median time lived in the neighborhood is 19 years, and only five percent of those interviewed had lived in the neighborhood less than a year.

Neighborhood attachment is further reflected by the majority (63%) of residents reporting greater loyalty to their neighborhood than to the city as a whole, and by the large percentage (44%) who have relatives living in the neighborhood.

Like neighborhood satisfaction, reported neighborhood attachment varied among those interviewed on the basis of a number of specific population characteristics. Older respondents expressed greater attachment to the neighborhood; black respondents were more attached than whites; and homeowners showed greater attachment than renters. Variations in income did not affect the intensity of attachment.

#### Reasons for Moving to the Neighborhood

Table 1 lists the reasons given for moving into the neighborhood. The single most important reason was the convenience of the neighborhood (24%); however, being born there or having friends, family or spouse living there combined to represent 38 percent of the total number of responses. This is another indication of the strength and importance of the social fabric of the

neighborhood. People live there because they have ties there. Housing is also important, being cited by 16 percent of the respondents.

Local Facility Use

Pittsburgh residents use their neighborhoods for basic living activities. Sixty-three (63) percent of the respondents do most of their main grocery shopping in or near their neighborhood; almost half (45%) frequently shop for small items, dry cleaning and so on in or near their neighborhood; over half (51%) attend religious services in or near the neighborhood; 45 percent use the health or medical services available near their place of residence; and 20 percent recreate in their neighborhood or nearby. The neighborhood is therefore an important provider of services for a large number of people.

The availability of shopping areas, recreation facilities, etc. varies among Pittsburgh's neighborhoods; and therefore, individual neighborhood analysis is essential in order to know what facilities are available and how intensive is their use.

Neighborhood Conditions

Respondents were asked to identify the most serious problem in their neighborhood. Responses covered a wide variety of problems and the general categories mentioned are shown in Table 2. Crime (15%), street repair and maintenance (11%), traffic and parking (11%), litter and garbage (10%), housing-related (8%) and youth-related (8%) were the most frequently mentioned problems. Fifteen (15) percent of the respondents were not concerned about any problem in their neighborhood.

Reasons to Remain in the Neighborhood

Percent of the respondents indicated that they plan to remain in their neighborhoods for the next five years. The primary reasons given for the anticipated stay were: a better place to live (23%), find a larger place to live (12%), school-related (10%), purchase a home (9%), re-locate (8%), neighborhood conditions (4%), marriage/divorce (3%),

Of those planning to move, 23 percent will move within the neighborhood, 29 percent will relocate to another neighborhood in the city, 17 percent will move to a suburb in Allegheny County, seven percent plan to reside outside of Allegheny County and 24 percent anticipate moving outside of Pennsylvania entirely.

Given the decision of a majority of the potential movers to continue to live within the city, there does not appear to be the prospect of large-scale outmigration from Pittsburgh. This indicates that the rate of population loss of the last few decades may be declining. Therefore, the city's population may be stabilizing at its current level.

#### Neighboring

Respondents reported a high degree of interaction with their neighbors. Fifty-one (51) percent visit regularly with neighbors; 60 percent help neighbors (or are helped by neighbors) with small tasks such as repair work or grocery shopping; 95 percent believe they could call on neighbors if an emergency arose; 38 percent feel that they have much in common with their neighbors; and 52 percent of the respondents report that the friend they socialize with most often lives in the neighborhood.

Neighboring patterns vary depending upon the characteristics of the household. Neighboring occurs more frequently for smaller households, younger respondents, white respondents, higher income households, homeowners and those living in the neighborhood for a longer period of time.

#### Neighborhood Organizations

Fifty-six (56) percent of the respondents are aware of an organization in their neighborhood that deals with neighborhood issues or neighborhood problems, and 17 percent of those interviewed belong to at least one such organization.

Of those who belong, the median length of membership in the organization is five years. A large majority (75%) of the respondents who were aware of the organization are satisfied with it.

#### Other Organizations

Fifty-five (55) percent of those interviewed belong to other types of voluntary organizations. Of those who belong to one such organization, church groups predominate (37%), followed by educational (12%), fraternal (11%), union (10%), recreation (9%), social welfare (6%), senior citizen (4%), professional (4%), political (2%) and civic (1%) groups. Most of these organizations are located in (49%) or near (15%) the neighborhood, with the balance being located in other parts of (29%) or outside of (7%) the city. The respondents' neighbors belong to over half (56%) of these organizations.

#### Job Location

Respondents who are currently working or have worked in the past have their primary place of employment in the city (63%), neighborhood (20%), or in the suburbs (13%). Neighborhood employment is highest for part-time workers, with 30 percent of the part-time males and 39 percent of the part-time females working in the neighborhood. Full-time female workers work in the neighborhood at higher rates than male full-time workers (24% compared to 14%).

Transportation to and from work is generally not a problem. Eighty-one (81) percent considered it to be no problem or only a minor problem.

#### Housing

In general, respondents were satisfied with their home or apartment. Only seven percent expressed dissatisfaction. In order to assess the willingness of city residents to maintain their housing, homeowners were asked whether they made

any major repairs or other improvements on their home during the past two or three years which cost more than \$500. Two-thirds replied affirmatively to this question.

#### Public Services

Two-thirds of the respondents are satisfied with the way the city provides services in their neighborhood. This level of satisfaction, however, varies from neighborhood to neighborhood with lower income respondents reporting lower satisfaction levels.

Table 4 shows the responses with respect to specific public services. Street cleaning received the lowest rating, with almost one-third of the respondents rating it poor. Street repair maintenance, animal control and police protection received the next lowest citizen evaluations. Fire protection received the highest rating, followed by street lighting, traffic control and public transportation.

---

### Schools

The respondents had children under 18 years of age, Pittsburgh is predominantly a city of adults. Fifty-eight percent of the respondents with children send their children to public school, eight percent to private, and the rest to public-parochial-private. Most of the children attend in their neighborhood, and 85 percent of the respondents are satisfied that their child (children) attends. The current high satisfaction may be a little misleading because since the survey, the city's desegregation plan has been implemented and fewer children attend public school in their own neighborhood. (In 1975, whether they had children attending public schools or not, 85 percent of the schools. Only 46 percent said they were

### Characteristics of the Sample

The household characteristics of the sample. The 1980 census data for the City of Pittsburgh are not yet available, making it impossible to compare the sample with current population data to assess its representativeness. However, based upon data from the 1970 census, it appears that the sample may be overrepresentative in certain areas. The authors do not believe that this materially affects the survey data.

### Conclusion

The survey shows that most city residents have positive feelings about their neighborhoods. Over 60 percent reported that they were strongly attached to it and almost three out of four rated it a good or excellent place to live. This does not mean that there are not problems. There are, and these problems vary from neighborhood to neighborhood. However, the attachment of city residents to their neighborhoods, despite the problems, provides a solid base from which to build and maintain a socially and economically sound city.

Neighborhoods in Pittsburgh have a strong social fabric. They provide their residents with a variety of services--almost half of the respondents use facilities for shopping and/or religious, health and recreational services in or near their place of residence. Neighboring activities are important for almost half of those interviewed, and almost all respondents believe they could turn to neighbors if an emergency arose. In addition, organizational involvement within the neighborhood is high (17% belong to a neighborhood organization, and 35% participate in other organizations in or near the neighborhood). Also, the neighborhood serves as an important work place for certain groups of people. Twenty (20) percent of those who are or were attached to the labor force work in the neighborhood, and the percentage is considerably higher for part-time workers.

People living in Pittsburgh's neighborhoods are not isolated. The percentage of respondents with kin in the neighborhood is high (44%) and almost all respondents report having friends in the neighborhood (75% have at least one).

Compared to the results of a 1975 city-wide survey, the 1980 results indicate that the attitudes of neighborhood residents toward their neighborhoods have become more positive. Satisfaction levels are higher and a greater percentage of respondents see their neighborhoods improving than was the case five years previously.

believe into the reasons for the change in the perception of their neighborhood. However, since the 1975 survey, there have been a number of initiatives taken by city government, and non-profit agencies which have brought increased resources.

Increased visibility of Pittsburgh's neighborhoods, various programs have been designed to strengthen the neighborhood. The Home Improvement Loan Program makes low-interest loans available to homeowners with incomes below \$25,000; the Neighborhood Improvement Program provides low-interest rate loans for neighborhoods; the Neighborhood Housing Program provides assistance to buyers of homes in certain parts of the city to help them afford a new home; Operation Paintbrush provides exterior painting services in a number of neighborhoods; Neighborhood Development provides assistance in designated neighborhood revitalization areas to community residents; the Urban Development Corporation has made below-market interest rate mortgage financing available in neighborhoods on the North Side; the City's Neighborhoods Office has worked to publicize every neighborhood in the city; and the Neighborhood Center is about to be established largely with city funds and neighborhood organizations.

But the point is clear. The City of Pittsburgh has invested a great deal of money for much of its programming. This new direction is that neighborhoods are the fundamental building blocks on which the city is built. If the foundation is not made solid, the city will not survive.

The city-wide survey has shown that Pittsburgh has a hidden strength and that is its people and the fabric of the social life that exists within each of the many different neighborhoods in the city. This social fabric is vibrant and the attitudes of the residents seem to be responding to the neighborhood initiatives taken by city government. The job, however, is not done. The city has an aging housing stock and a number of poorer neighborhoods; the public school system needs support from city government as its parent constituency declines; and a few neighborhoods are losing their shopping facilities as local business districts deteriorate. But, the steps which are being taken by city government, neighborhood organizations, neighborhood residents and non-profit agencies are mutually supportive and are beginning to show results. The city is moving in the right direction, but there is still a large minority of the population whose loyalty and attachment must be won.

NEIGHBORHOOD APPENDIX
